

-- Figure 7 shows a bottom view of a cover plate 6, under which the slot cover 1 according to the present invention is arranged. The selector lever 8 - fixed in a sideways pivoted position - is indicated by broken line here as well, in which case the slot cover 1 has also been displaced in relation to the cover plate 6. The displaceability of the slot cover 1 in relation to the cover plate 6 may be achieved, e.g., by the support structure 5 itself being fastened on the shifting device or on the slot cover 1 with a bracket 16, which allows a lateral movement of the slot cover. It would be possible, e.g., to clip the slot cover 1 with the axes of the broad deflecting rollers 3.1 and 3.2 in a clamp on the narrow sides, where the clamps are substantially narrower in their broad extension than the length of the broad deflecting rollers, so that the entire slot cover 1 can be moved on it from right to left.--

IN THE CLAIM:

Please amend Claim 37 as follows:

37. (Amended) A cover in accordance with claim 36, wherein:

said first and second directions are in a plane substantially parallel to a plane of said cover plate.

Please amend Claim 38 as follows:

38. (Amended) A cover in accordance with claim 36, wherein:

said louver guide is movably connected to said cover plate in said second direction by a bracket.
